

All you need to know about
Herdflow®

Reporoa Engineering (1982) Limited

Reporoa Engineering became well known for contributing to farming success across New Zealand since 1982 by delivering reliable, durable and clever designs.

From humble beginnings Colin Millar created a strong engineering workshop based in the rural farming community of Reporoa, New Zealand. His creation of the nationally recognized backing gate the Reporoa High Lift Gate®, revolutionized yard management for many farmers throughout New Zealand and overseas.

Reporoa Engineering became well known for contributing to farming success across New Zealand and internationally since 1982 by delivering reliable, durable and clever designs. It is this success that led Reporoa Engineering in 2007 to expand and move their main office and workshop to new premises in Rotorua. A new direction meant new international aspirations and they have since forged partnerships in South America, USA and UK.

It was a big year in 2008, along with re-branding the company, new premises and a new direction their focus turned to the launch of HERDFLOW®. Demonstrating their 'big picture' approach to Dairy Farm building design and construction. The HERDFLOW®

approach is about providing engineering that focuses on the needs of the dairy farmer, with particular emphasis on reducing animal stress to increase milk yield, ensuring ease of use and increasing efficiency in the yard.

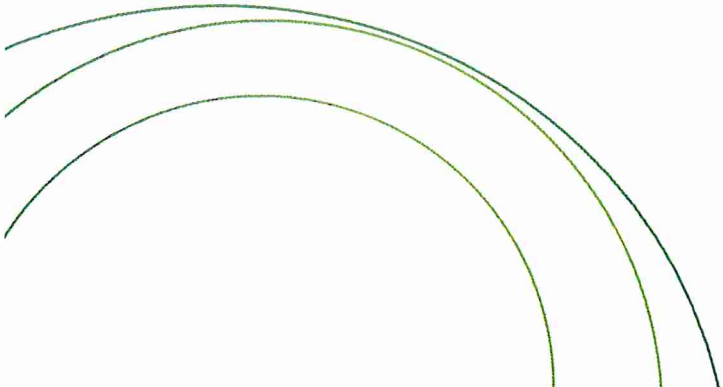

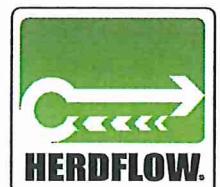

Today, Reporoa Engineering continues to deliver reliable and robust engineering to the dairy farming community in New Zealand and overseas through their flagship brand HERDFLOW®.
